

# IR AIR- EMITTER

# COMPOSE YOUR OWN SYMPHONY

Want to enjoy the latest advances in controlling your electrical appliances that work together or separately in the most harmonious way? Here's what you need. The Air Infrared Emitter, a TIS WIFI product for controlling your AC, TV, home theatre, and other appliances with the highest quality performance.

This controller is compatible with any universal brand, including Samsung, Sony, LG, etc., and is available in two types: AIR-1IRE-T and AIR-2IRE.

**AIR-1IRE-T:** This Air piece has an infrared emitter port and a temperature sensor. This means you can control any infrared device with it and manage your home's AC with the temperature sensor, so no energy is wasted and the room temperature is always suitable. For example, imagine you decide to throw a small surprise party for your partner.

Using your phone and a few button touches while you are on the way, you can set the AC to a pleasant temperature and even turn on the audio system to play “Happy Birthday” the moment you open the door. Sweet, isn't it? Air-1IRE-T helps you create unforgettable moments.

**AIR-2IRE:** This emitter has 2 separate infrared ports used to control two infrared devices of the same brand separately; however, its main utility is for home theatre devices such as TV, DVD, SAT BOX, Apple TV box, etc. Ever experience that moment when a remote control goes missing and you have to turn the device ON/OFF using the buttons on the device? There is no need to keep 5 or 6 remote controls next to you anymore. Controlling your home theatre becomes much easier when all the settings can be configured via your iPad or iPhone?

These two panels share the ability to connect directly to the Internet, and since they are equipped with WIFI technology, it is possible to manage them remotely. Just make sure you have the TIS application on your smart phone.

Moreover, they do not limit you from utilizing remote controls. You can use both an Infrared Emitter and the device's own remote control to manage them. This option is favorable for those who like classic technology or simply find remote controls more dependable.

Another feature of this Air product is that it is open to scheduling. Define a specific action to take place at a specific time, and let it assist you in your modern lifestyle. Imagine having the shop warm and comfortable when you arrive on cold winter mornings. Wouldn't it be delightful for your staff if they do not have to wait for the shop to heat up when they arrive to work? The AC can also be set turn on automatically a quarter hour before they arrive.

Athan logic gives prominence to this solution, especially for Muslims. The infrared emitter can be scheduled to turn the AC system on/off at specific times. Leaving the AC system ON in mosques results in a tremendous waste of energy, so it is wiser to only turn it on when there is going to be human occupancy.

For example, if Athan is at 12:45 p.m., mosque ACs can be set to automatically start working at 12:15 p.m. This way, even with the change in the time of Athan during different seasons, the AC system is still turned on a half an hour before everyone arrives. This capability guarantees energy management in the most advanced way.

TIS's Infrared Emitter can be your orchestra leader. It manages infrared devices to function neatly in the most convenient way along with a considerable reduction in energy consumption.
